Project 4: Fraud Detection in Financial Transactions

Description:

The project aims to solve the problem of fraud detection in financial transactions using machine learning. By analyzing the provided dataset containing transaction details, customer information, and fraud labels, we can build a predictive model to identify fraudulent transactions. The project will utilize Scikit-learn, Python Pandas, and Tableau for data analysis, model training, and visualization.

Outline

- Python Pandas
 - Jupyter notebook to:
 - Load, read, explore, and clean up data
 - Build, test, and optimize the machine learning model using Scikit-learn and TensorFlow
 - Tableau
 - Bar graphs (display data before and after training)
 - Bar graph (display correlation between account type / average transaction amount and whether an account is fraudulent)
 - Pie chart (distribution of transaction types)
 - Correlation heatmap (determine which factor has the highest impact on fraud detection)
- Dashboard
 - Display data and findings
